

WAVE3 ORDER SYSTEM

ADMIN STANDARD OPERATING PROCEDURE

Orders · Payments · Stock · Income & Expenses

WAVE3 COLLECTIVE — The movement continues.

July 2026 · Version 1.0

Your system at a glance

This document is your step-by-step manual for running the Wave3 order system day to day.

Store (customers)	Use the live store link Jhon gives you — that is the link you share with buyers. (While still testing on Jhon's PC it is <code>http://localhost:3737</code> , which only works on that PC.)
Admin dashboard (you)	Same address with <code>/admin</code> at the end — e.g. <code>your-store-link/admin</code>
Admin password	Ask Jhon for the admin password. If it is still the default (wave3admin), change it in Settings on day one
Customer order link	Every order gets a private link like <code>/order/W3-ABC123</code> — it is the customer's tracker AND receipt
Something broken?	Contact Jhon (owner / IT) — do not edit anything on the server or PC yourself

Change the admin password first. Log in to the dashboard, go to Settings, scroll to "Change admin password". Anyone who knows the default password can see and change your orders and money records.

How an order flows (the big picture)

- 1 A customer opens your store link, picks their sizes and quantity, fills in their name, mobile number, and delivery address, and taps **Place order**.
- 2 Placing the order **reserves the shirts** immediately (so no one else can grab them) and starts a 24-hour payment countdown (change the window in Settings). It's the same idea Shopee/Lazada use: pay in time and it's yours; don't pay and the order **expires automatically**, releasing the stock.
- 3 Because a default shipping fee (currently **125**) is set, the customer sees their **full total right away** (items + shipping) and can pay immediately — no action needed from you at this stage. You can still adjust a specific order's shipping with **Edit shipping fee** if that customer's location costs more or less.
- 4 The customer's private order page shows the amount due, the payment countdown, and all your payment channels (Metrobank, BDO, GCash, USDT) with copy buttons and QR codes. Their page refreshes on its own, so they don't need to reload.
- 5 After paying, the customer uploads a **screenshot of their payment** on that same page. Uploading proof **stops the countdown** — their order is safe while you verify.
- 6 The order appears in your dashboard under **To verify**. You check the money actually arrived, then click **Mark as PAID**.
- 7 The moment you mark it paid: the sale is **logged as income automatically** and the customer's order page turns into an official **receipt with a PAID stamp** — a full breakdown of items + shipping + total — they can save or print.
- 8 You pack the order, click **Mark as shipped**, and click **Add tracking** to paste the courier tracking number — the customer sees it on their order page. Done.

SOP 1 — Your daily routine (5 minutes)

- 1 Open the admin dashboard and log in.
- 2 Look at the **To verify** number first — these are customers who already sent payment proof and are waiting for you to confirm.
- 3 Then check **Awaiting payment** — orders placed but not yet paid. Each shows how long until it expires. You don't have to chase anyone: orders with no proof expire on their own and release their stock — you'll find them later under the **Expired** tab.
- 4 Only if you switch off the default shipping fee (set it to 0 in Settings) will orders arrive tagged “**Needs shipping quote**” — meaning you must set each one's fee before the customer can pay (see SOP 3).
- 5 Glance at the **Low stock** alerts so you know what is about to sell out.
- 6 The dashboard refreshes by itself every 30 seconds — the Orders badge in the sidebar shows how many orders need your attention.

SOP 2 — Verifying a payment and marking it PAID

- 1 Go to **Orders** and open the **To verify** tab.
- 2 Click the screenshot thumbnail to view it full size.
- 3 Open your real banking / GCash / wallet app and confirm the money **actually arrived** in your account.
- 4 Check the **amount matches the order total** shown on the order card, and the sender name is consistent with the customer.
- 5 If everything checks out, click **Mark as PAID**. Income is logged under Sales automatically and the customer instantly gets their receipt. No stock race is possible — the shirts were already reserved for this customer when they ordered.
- 6 If you clicked it by mistake, use **Undo paid** — the logged income is removed (the shirts stay reserved for the order), so your records stay correct.

Never mark an order paid from the screenshot alone. Screenshots can be edited. Always confirm the money is in your actual account first — your poster says it best: first PAID, first served.

SOP 3 — Shipping fees

Your store has a **default shipping fee of ₱125**, so every order is priced and payable the moment it comes in. You only touch shipping when a particular order needs a different amount.

- 1 **Change the default for everyone:** Settings → Default shipping fee → type the amount (numbers only) → Save all settings. It applies to new orders from then on.
- 2 **Adjust one specific order:** open the order and click **Edit shipping fee**, enter the amount (numbers only; 0 = free shipping). The customer's total updates on their page within seconds.

- 3 **Quote every order by hand instead:** set the default shipping fee to **0**. Then each new order arrives tagged “■ Needs shipping quote”, the customer sees a “waiting for your shipping fee” message with no timer yet, and you click **Set shipping fee & start timer** per order. Setting it reveals the total + payment channels to the customer and starts their countdown.

SOP 4 — Cancelling an order (restocking)

- 1 Unpaid orders expire by themselves, so you rarely need this — but use **Cancel order** when a customer backs out or a payment proof turns out fake.
- 2 The shirts go **back into stock automatically** and any logged income for the order is removed.

SOP 5 — Shipping

- 1 Only **paid** orders can be shipped — the button appears after you mark it paid.
- 2 Pack the order, book the courier, then click **Mark as shipped**.
- 3 Click **Add tracking** and paste the courier tracking number — or a full tracking link (starting with http). The customer's order page shows it instantly: a number gets a copy button, a link gets an "Open tracking page" button.
- 4 The customer's order page also updates to "Your order has been shipped!" — no need to message them one by one.

SOP 6 — Managing stock and products

- 1 Go to **Inventory**. Each product shows its sizes, measurements, and current stock.
- 2 When new shirts arrive from your supplier, type the new stock numbers and click **Save product**.
- 3 Use **+ Add size** for new sizes (e.g. 2XL) or **+ New product** when you drop a new design.
- 4 To hide a product from the store without deleting it, untick **Visible in store** and save.
- 5 Remember: you never need to subtract stock for orders — it is reserved the moment an order comes in, and returned automatically when an order expires or you cancel it.

SOP 7 — Tracking income and expenses

- 1 Sales income is recorded **automatically** every time you mark an order paid — do not add it again by hand.
- 2 Record your costs in **Money > Add a transaction**: shirts from the supplier, embroidery, courier fees, boosting posts, etc. Pick the closest category.
- 3 The three cards on top always show your running totals: **Income**, **Expenses**, and **Profit** (income minus expenses).
- 4 Made a typo? Delete the transaction with the small delete button on its row and enter it again.
- 5 **Reports:** the Money page has a Report section — pick a date range and click Run report to see gross sales, expenses, profit, orders paid, items sold per size, and totals by category.

- 6 **Excel export:** the two Export buttons download all orders and all money records as files that open straight in Excel — handy for month-end bookkeeping.

SOP 8 — Manual orders (walk-in / DM / past sales)

- 1 Use this for sales that didn't come through the website: walk-ins, DM orders, or old orders from before the system existed.
- 2 Go to **Orders** and click **+ Manual order**.
- 3 Only the customer's **name** is required; phone and address are optional.
- 4 Set the quantity per size, the shipping fee (if any), and the **sale date** — use the real date for past sales so reports stay accurate.
- 5 Keep **Already paid** ticked for completed sales: income is logged on that date and the customer gets a receipt link like any other order.
- 6 **Deduct from current stock** — the important checkbox: keep it ticked for fresh sales; UNTICK it for old orders if today's stock count was taken after that sale (those shirts are already counted out — deducting again would double-count).

Habit that pays off: record an expense the same day you spend it. Five seconds per entry gives you a true profit number at the end of the month.

SOP 9 — Settings

- 1 **Payment channels:** edit or add channels (new bank account, new GCash number, other crypto). One detail per line. You can also **upload the channel's QR code** — customers scan it instead of typing account numbers, which is faster and avoids wrong-account mistakes. Click **Save all settings** when done — the customer payment page updates immediately.
- 2 **Contact channels:** add the links customers use to message the shop — Messenger (m.me/...), Telegram (t.me/...), Instagram, WhatsApp, anything. They appear as "Message us" buttons on the store and on every customer's order page.
- 3 **Payment instructions note:** the friendly message customers see above your channels.
- 4 **Default shipping fee:** 0 means "to be confirmed" (you set it per order); any other number is charged automatically.
- 5 **Payment window:** how many hours a customer has to send proof before their order expires and the stock is released. Default is 24, like Shopee. Set it anywhere from 1 to 168 hours.
- 6 **Change admin password:** enter the current one and the new one (at least 6 characters).

SOP 10 — Keeping the system healthy

- 1 **If a page will not load** or something looks wrong, refresh once, then contact **Jhon (owner / IT)**. Do not try to fix the server, files, or settings you don't understand.
- 2 **Never share the admin link or password** with anyone outside the team. Anyone with it can see and change orders, stock, and money records.

- 3 **Backups and hosting are Jhon's job** — if you notice orders or screenshots missing, report it to Jhon immediately.
- 4 **Any change requests** (new products, price changes you can't do yourself, new payment channels, going live, new features) — message Jhon.
